Commissioner for Patents

The reply brief filed on May 8, 2007, has been entered and considered, but no further response by the examiner is deemed necessary. The application has been forwarded to the Board of Patent Appeals and Interference for decision on the appeal.

Appellant argues in the Reply Brief, that (1) Bass does not buffer incoming packets differently based on the destination

As to point (1), the Examiner disagrees. As evidenced in the Examiner's Answer, Bass discloses that the destination is determined based on the destination (i.e. if the packet is received from the network, then the destination is always the second interface into the switch fabric to the second routing component). Irregardless of the claimed limitation, the second limitation does not necessarily have to occur in order to meet the claim. The packet is buffered in the external memory only "when the destination requires forwarding of the data to the network via the first interface", however since the packet received from the first interface only goes to the second interface (and to another routing component), this limitation does not occur, since the packet is buffered in internal memory "when the destination requires forwarding of the data to the second routing component". Appellant is advised that although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).

By this rationale, the rejection should be maintained.
